

Polar Clear Little Blue – AQP-10CS/AO/VC

Trouble Shooting - leaking between the filter container and unit.

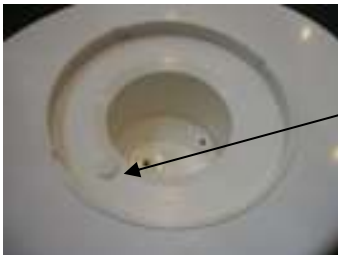

1.

Remove the blue bottle from the bottom of the unit and place blue container upside down.

If there is any water in the unit, drain it all from the drain hole at the back of the cooler.

2.

Make sure little white rubber plug is in the hole, and pushed down completely in place.

3.

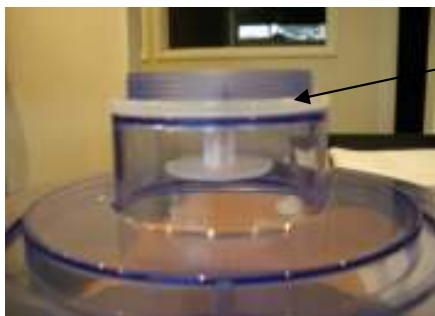

Wipe inside and top of the cooler completely dry of any water.

4.

Wipe the inside and outside of blue bottle completely dry of any water. (As done in step 3)

5

Unscrew the blue ring from the base of the bottle.

Ensure that the o-ring is sitting evenly in its place as shown in the picture.

If the o-ring is damaged or not fitting into the groove properly, please call us so we can send you out a replacement ring.

6

Place the clear plastic washer onto the o-ring ensuring that it is sitting on there evenly. This will hold the o-ring evenly in place.

7

Once the o-ring and washer is in place, screw the blue ring back on with the flat side facing down. Keep screwing the washer until you feel it lock into place and can't go any further.

Put the thread on the filter bottle
throat

8

Place the bottle back into the bottom unit slowly, and you should feel a bit of pressure whilst doing this. Ensure that the 2 compartments are locked completely together.
